

Asset Integrity - Norway

- Our scope for asset integrity covers: From well to onshore
 - Key issues: Safety critical systems, process systems, structures, wells
- The foundation for facility/equipment lifetime is established in the design phase
- However, prevailing conditions always cause reduction in lifetime - all assets are exposed to aging
- The challenge is to maintain the condition of the facilities and continuously improve the level of safety
- In Norway, application for consent to extend lifetime must be sent one year before the official lifetime expires
- Since there are no standards for lifetime extension available, we have requested the OLF to develop such standards
